**Abstract:**

Forest reserve as a model area for future climate forest restoration - a case study

We adapted and parameterised the CO2FIX carbon sequestration model for near-natural, unevenaged, mixed forests. For this adaptation we made the retrospective case study of the Várhegy Forest Reserve (Bükk mts, North Hungary), which is dominated by Pannonian oak woods (91G0, 91H0, 91M0). Through forest inventory data (from 1880 to 2006) and a detailed survey in 2005, we followed the history and the carbon sequestration of the Várhegy forest with the CO2FIX model. We ran four scenarios to show the significance of unexpected events in creating near-natural (climate) forests and estimating their carbon sequestration.

forest management

forest history

climate: climate change

methodology: modelling
